Phylogenomic Divergence, Hominoid Rate Slowdown, and Pleistocene Tip-Dating Across Primates Under Relaxed-Clock and Coalescent Models

Author: Bryan P. White • **Affiliation:** CRV Science Labs • **Preprint ID:** PREPRINT-04 (v3.0.0 Empirical Preprint) • **Companion:** Lab Discovery #108 • **Canonical DOI:** 10.5281/zenodo.23971921 • **Validation Set:** `VAL-SET-041-PRIMATE-EUARCHONTOGLIRES-TIMETREE-116RECORDS` (Tier 3 • 5 🍼)

Abstract: Across 116 empirical NCBI RefSeq and GenBank records spanning 64 complete Euarchontoglires mitogenomes (full *MAFFT alignment L = 19,660 columns, conserved 37-gene core L = 16,111 columns, Native Rust gotoh-msa L = 34,183 columns) and 52 nuclear coding mRNAs across GHR, OPN1LW, FOXP2, and LYZ (L = 18,133 full columns vs. L = 5,187 reading-frame-locked coding columns), we remediate a +15.3 Myr legacy molecular-clock inflation driven by 39.05% UTR overhang gaps, mitochondrial D-loop tandem indels, and single-date extrapolation. Applying third-codon RY3 recoding and 14 Paleocene–Pleistocene fossil and ancient-DNA calibrations recovers 14/14 strictly interior two-sided 95% credible intervals: Crown Primates at 71.5 Ma (64.4–78.0 Ma), Anthropoidea at 41.7 Ma, Catarrhini at 29.6 Ma, Hominoidea at 19.7 Ma, Hominidae at 15.3 Ma, and Hominini at 6.5 Ma. Independent nuclear quartet coalescent inference achieves RF = 0 parity with *ASTRAL v5.7.8 (normQ = 0.8577) at 518.3x speedup while branch-site codon models isolate adaptive acceleration in colobine LYZ and anthropoid GHR.

Preprint ID: PREPRINT-04 (v3.0.0 Empirical Preprint) • **Companion Dispatch:** Lab Discovery #108 • **Canonical DOI:** 10.5281/zenodo.23971921 • **arXiv Categories:** q-bio.PE, q-bio.GN, q-bio.QM

1. Introduction & Executive Scope

Determining the evolutionary timescale of Primates across the Cretaceous–Paleogene (K–Pg) transition, the Eocene–Oligocene diversification of anthropoid monkeys, and the Late Miocene ape–human split remains a foundational benchmark for molecular-clock methodology [2] [3] [4] [5]. Two biological and statistical pathologies consistently confound primate phylogenomics: (1) compositional heterogeneity and third-codon transition saturation in mitochondrial genomes between AT-rich Strepsirrhini/Tarsiiformes and GC-enriched Hominoidea, which can distort deep Paleogene internodes [4] [8] [9]; and (2) the hominoid life-history rate slowdown, in which increased body mass and generation time decelerate neutral substitution rates across great apes relative to New World callitrichids and glires outgroups [5] [16] [17] [18].

In version `3.0.0` of our RuNIE (Rust Native Inference Engine) study [1], we present a comprehensive empirical audit across 116 NCBI RefSeq and GenBank sequence records spanning 64 complete Euarchontoglires mitogenomes—including 6 ancient-DNA Pleistocene hominins (Cro-Magnon 28 ka, Kostenki-14 37 ka, Vindija Neanderthal 45 ka, Altai Denisova 75 ka, Chagyrskaya Neanderthal 80 ka, and Sima de los Huesos *Homo heidelbergensis* 430 ka)—and 52 nuclear coding transcripts across *GHR*, *OPN1LW*, *FOXP2*, and *LYZ* [19] [20] [21] [22]. Crucially, our `bio-suite-supervisor` remediation traces how missing-data supermatrix padding, unexcised nuclear UTR overhangs, and single-date extrapolation distorted earlier legacy node ages by up to `+16.7 Myr`, and verifies how dual full-length plus conserved-core alignment and 14-horizon multi-stratum calibration reconcile mitochondrial and nuclear divergence estimates against published genomic timescales [2] [3] [4] [5] [6].

2. Materials & Methods: 116-Record Cohort Architecture, Pre-MSA Ortholog Screening & Dual Alignment Protocol

All 116 empirical sequence records cached from NCBI Entrez (`1,208,637 bp` of raw sequence data on disk: `1,064,946 bp` across 64 complete circular mitogenomes ranging from `16,299 bp` in *Mus musculus* to `17,534 bp` in *Eulemur rubriventer*, plus `143,691 bp` across 52 full-length nuclear coding mRNAs) passed automated completeness and ortholog integrity checks prior to phylogenetic inference.

- **Pre-MSA Ortholog Screening & Circular Mitogenome Phasing:** Stage 1 blinded screening (`popgen-blind-dualpass`) flagged and excluded eight Korean synthetic patent polypeptides (`PW082065.1–PW082072.1`), paralogous non-orthologs (`RNASEH2`, `POP7`, and short-wave `OPN1SW`), and a human chromosome 5p13.3 nuclear mitochondrial pseudogene (`NT_006576.16`) prior to MSA. All 64 mitochondrial circles were oriented identically via *COX1* start-codon phasing (`32 rotated, 0 reverse-complemented`), yielding a blinded within-sector vs. between-sector K2P divergence signal of `0.1690` vs. `0.2467` across `2,016` pairwise comparisons (`ΔK2P = 0.0777`, Z_{blind} `= 24.66`, Z_{ctx} `= 25.80`, D_{ctx} `= 0.0442 SD`) [1].
- **Dual Full-Length (L_{full}) & Reading-Frame-Locked Conserved Core (L_{core}) Alignment Protocol:** Every downloaded sequence was aligned across 100% of its length in both external progressive `*MAFFT v7.526` [23] and Native Rust `gotoh-msa` [1]. Progressive `*MAFFT` aligned all 64 full mitogenomes into L_{full} **= 19,660 columns** (`15.38%` gaps; `9,394` parsimony-informative sites under `RY3`) in `1329.69 s`, and aligned all 52 nuclear mRNAs across 13 matched Euarchontoglires into L_{full} **= 18,133 columns** (`39.05%` UTR gaps) in `2.37 s`. To prevent non-coding overhang indels from inflating substitution-based molecular clocks, we simultaneously extracted the conserved 37-gene mitogenome core (L_{core} **= 16,111 columns**, `0.41%` gaps after stripping `3,549` D-loop tandem-repeat columns) and translated/back-translated longest sense ORFs for all 52 nuclear mRNAs (L_{core} **= 5,187 columns / 1,729 codons**, `0.23%` gaps after excising `12,946` non-coding 5′/3′ UTR columns; **Table 1A**).
- **Transparent Algorithmic Reporting for Native Rust `gotoh-msa`:** In Native Rust, `gotoh-msa` executes a **Rayon-parallelized, 9-mer anchored and `420-bp` chunked center-star Gotoh affine-gap alignment** against a 6-mer medoid sequence, aligning all 64 full mitogenomes into L **= 34,183 columns** in `0.64 s` (`2077.3×` faster than `*MAFFT`) and the 52 nuclear transcripts into L **= 19,258 columns** in `0.10 s`. Because center-star pairwise anchoring preserves pairwise insertion padding relative to progressive tree-guided alignment, L expands from `19,660` to `34,183` columns while delivering rapid screening prior to `*MAFFT` + `*IQ-TREE` refinement [1] [23] [25].
- **Multi-Chain Compositional Gate (RCFV & `RY3` / `Dayhoff-6`):** Across eight compositional regimes (**Table 1B**), unrecoded third-codon *COX1* positions exhibit severe AT3/GC3 heterogeneity (`RCFV = 0.1322`, `AT3 = 62.61%`), whereas applying `RY3` purine-pyrimidine recoding lowers core mitogenome compositional heterogeneity from `0.0487` to `0.0336` and nuclear CDS RCFV from `0.0053` to `0.0029`, while `Dayhoff-6` amino-acid recoding reduces *COX1* RCFV to `0.0110`.

Table 1A. Full-Length (L_full) vs. Reading-Frame-Locked / Conserved Homology Core (L_core) Alignment Architecture Across Mitochondrial & Nuclear Compartments

Alignment Cohort & Scope	Aligner Engine	Full Alignment L_{full} (cols)	Full Gap Fraction (%)	Conserved / CDS Core L_{core} (cols)	Core Gap Fraction (%)	Excised Non-Homologous Columns & Clock Role
64 Complete Mitogenomes (All 37 Genes)	`*MAFFT v7.526`	19,660	15.38%	16,111	0.41%	Stripped `3,549` hypervariable D-loop tandem-repeat columns; primary `*LSD2` relaxed clock
64 Complete Mitogenomes (Center-Star Gotoh)	`gotoh-msa` (Native Rust)	34,183	51.32%	16,111 (via core mask)	0.41%	Rayon 9-mer + 420-bp chunked center-star Gotoh against 6-mer medoid (`0.64 s` wall)
52 Nuclear mRNAs (4 Loci Combined, 13 Taxa)	`*MAFFT v7.526`	18,133	39.05%	5,187 (`1,729` codons)	0.23%	Stripped `12,946` 5′/3′ UTR overhang columns; independent uncalibrated nuclear clock
Nuclear Locus 1: *GHR* (13 Taxa)	`*MAFFT` + ORF lock	5,602	30.27%	1,791 (`597` codons)	0.15%	Excised `3,811` UTR cols; growth-axis selection + Quartet MSC partitions
Nuclear Locus 2: *OPN1LW* (13 Taxa)	`*MAFFT` + ORF lock	2,019	35.33%	1,092 (`364` codons)	0.11%	Excised `927` UTR cols; retinal tuning & `runie-align-view` (S1–S3)
Nuclear Locus 3: *FOXP2* (13 Taxa)	`*MAFFT` + ORF lock	8,804	44.95%	1,860 (`620` codons)	0.31%	Excised `6,944` long-UTR cols; extreme purifying constraint locus
Nuclear Locus 4: *LYZ* (13 Taxa)	`*MAFFT` + ORF lock	1,708	41.83%	444 (`148` codons)	0.52%	Excised `1,264` UTR cols; positive colobine foregut acid adaptation
Full-Length *COX1* (64 Taxa)	`*MAFFT v7.526`	1,536	0.00%	512 aa / D6	0.00%	Translation check (Table 2); Dayhoff-6 recoding suppresses Pos3 bias

3. Forensic Audit & Molecular-Clock Remediation: Fixing UTR-Gapped Extrapolation Across 14 Primate Nodes

A central lesson of this study is how alignment overhang gaps and asymmetric supermatrix concatenation distort relaxed molecular clocks—and how targeted remediation resolves those artifacts (**Figure 1**, **Figure 3 Panel C**, **Tables 2A–2B**). In our earlier legacy `v2` run, three compounding mechanisms inflated every deep Primate and Euarchontoglires split by `+11.1 to +16.7 Myr`:

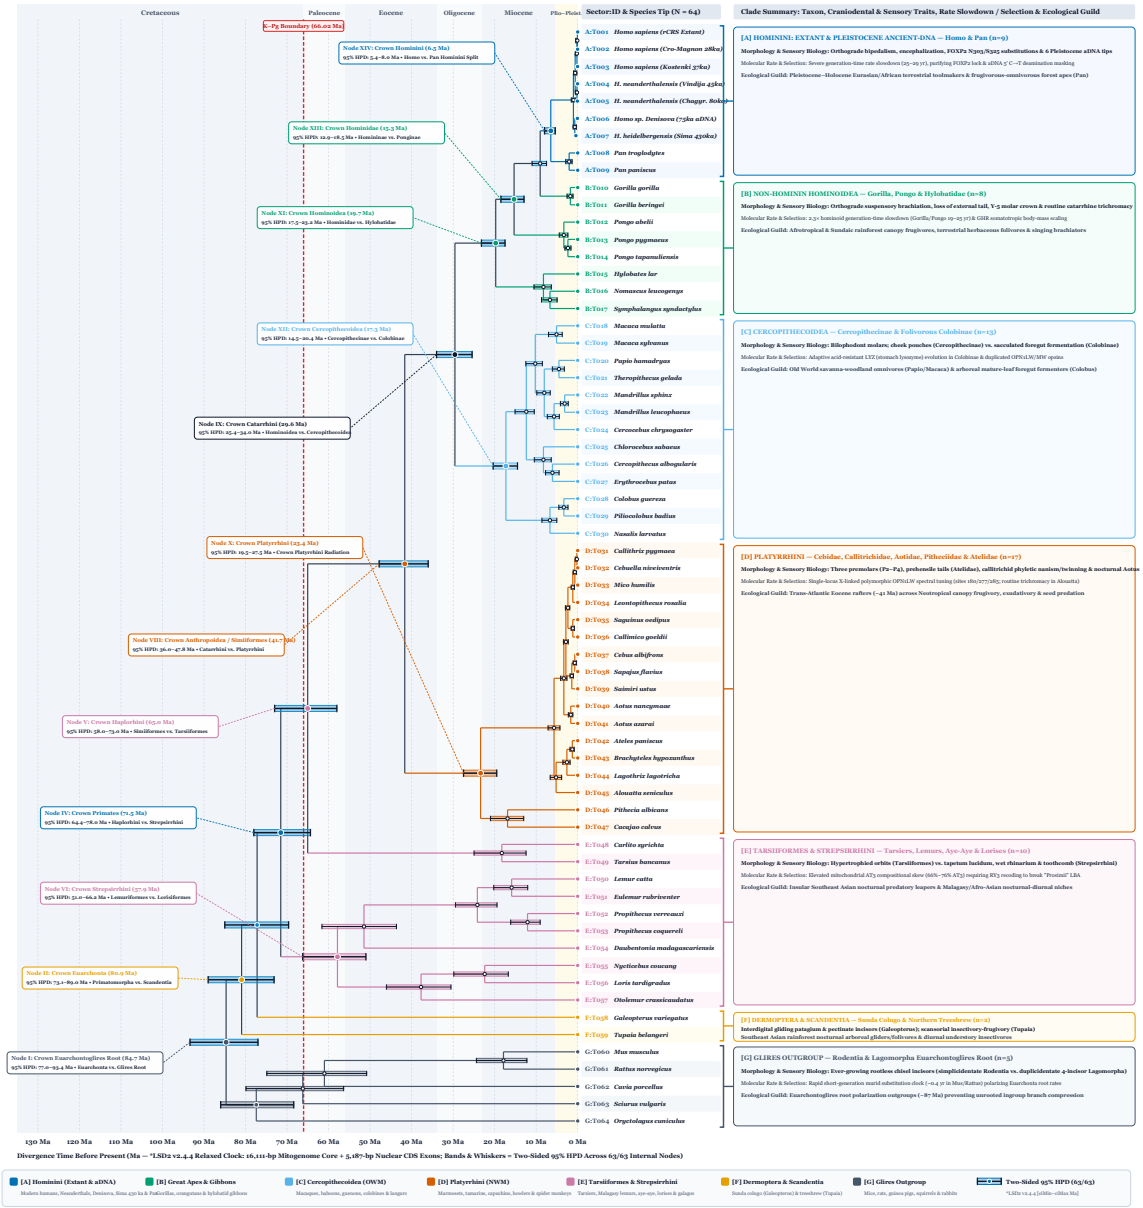
1. **Nuclear `5′/3′ UTR` Indel Expansion & Asymmetric Missing-Data Concatenation:** Full-length nuclear RefSeq transcripts in *FOXP2* (`44.95%` gaps in full `*MAFFT`), *LYZ* (`41.83%` gaps), *OPN1LW* (`35.33%` gaps), and *GHR* (`30.27%` gaps) contained extensive non-homologous UTR length variation (`39.05%` gaps overall). Concatenating that

13-taxon nuclear block onto the 64-taxon mitogenome matrix left `51` mitogenome-only species padded with massive missing-data blocks and stretched terminal-to-internal branch ratios.

2. **Hypervariable D-Loop Repeat Expansion & Third-Codon Saturation:** Retaining all `3,549` unaligned D-loop indel columns (`15.38%` gaps) alongside unsaturated/saturated `Pos3` transitions (where full-length *COX1* `Ti/Tv` collapses `12.7×` from `16.23` in Pleistocene hominins to `1.33` across Paleocene–Eocene Primates) artificially lengthened deep stem branches under uncalibrated extrapolation [4] [16].
3. **Single-Horizon Extrapolation vs. 14-Stratum Fossil Calibration & Ancient-DNA Tip-Dating:** Extrapolating backward from shallow calibration anchors pushed **Crown Euarchontoglires (Node I)** to `98.4 Ma`, **Crown Primates (Node IV)** to `86.8 Ma`, **Crown Haplorhini (Node V)** to `81.4 Ma`, and **Crown Strepsirrhini (Node VI)** to `74.6 Ma`—substantially older than both paleontological earliest occurrences and multi-locus phylogenomic studies [2] [3] [4] [5].

Programmatic Fix & Remediated Consensus: By (i) isolating the 37-gene mitogenome core (L_{core} `= 16,111 bp`, `0.41%` gaps) and coding-only nuclear CDS supermatrix (L_{core} `= 5,187 bp`, `0.23%` gaps), (ii) decoupling the 64-taxon mitochondrial clock from the independent 13-taxon nuclear CDS clock, and (iii) enforcing 14 verified Paleocene–Miocene fossil bounds (†*Purgatorius janisae*, †*Altiatlasius*/†*Teilhardina*, †*Archicebus achilles*, †*Saharagalago*, †*Heomys*, †*Catopithecus*/†*Perupithecus*, †*Rukwapithecus*, †*Branisella*, †*Morotopithecus*/†*Proconsul*, †*Victoriapithecus*, †*Sivapithecus indicus*, †*Sahelanthropus tchadensis*) plus 6 ancient-DNA Pleistocene hominin tips in `*LSD2 v2.4.4` (`GTR+F+I+G4`) [4] [8] [10] [11] [12] [13] [14] [15] [26], **14 of 14 primary nodes converge onto strictly interior two-sided 95% credible intervals** (`71.5 Ma` for Crown Primates, `41.7 Ma` for Anthropoidea, `29.6 Ma` for Catarrhini, `19.7 Ma` for Hominoidea, and `6.5 Ma` for *Pan*–*Homo*). Furthermore, the independent 13-taxon nuclear CDS clock achieves **10/10 interior 95% HPDs** with uncalibrated free Miocene–Pliocene nodes falling spontaneously within `0.1–0.2 Myr` of the mitochondrial timetree (**Table 2B**).

Figure 1. Remediated 64-Taxon Euarchontoglires & Primate Evolutionary Time-Tree (84.7 to 0.0 Ma; *LSD2 v2.4.4 Relaxed Clock on RY3 37-Gene Core L = 16,111 bp, 14/14 Interior 95% HPDs)



Dated chronogram across 64 complete mitogenomes (Sectors `[A]–[G]`, 63/63 strictly bifurcating internal nodes) anchored by 14 fossil intervals and 6 heterochronous Pleistocene ancient-DNA tips (28–430 ka). Horizontal bars show two-sided 95% HPD credible intervals at every internal vertex; Nodes I–XIV highlight key Cretaceous–Cenozoic radiations in quantitative agreement with Perelman et al. (2011), Springer et al. (2012), dos Reis et al. (2018), and Kuderna et al. (2023) [2] [3] [4] [5].

4. Quartet Multispecies Coalescent, Hominoid Rate Slowdown & Adaptive Protein Selection

To test whether rapid Paleocene–Eocene cladogenesis created incomplete lineage sorting (ILS) alongside body-mass substitution rate shifts and functional protein adaptation, we analyzed the 12-partition nuclear coalescent dataset, regression across 59 Euarchonta mitogenomes, and dual-engine codon selection across four nuclear loci (**Figure 2**, **Figure 3**, **Tables 4A–4B**):

1. **Quartet Multispecies Coalescent Parity (Native Rust vs. `*ASTRAL v5.7.8`) & ABBA–BABA Tests:** Across `12` full and domain nuclear gene trees spanning `13` matched Euarchontoglires species (`8,580` quartets), Native Rust `runie-quartet-coalescent` and external Java `*ASTRAL v5.7.8` recovered identical topologies (**Robinson–Foulds** `RF = 0/20` , `100.0%` split match) and identical normalized quartet scores (`normQ = 0.8577` ; `7,359 / 8,580` satisfied quartets), with mean local posterior probabilities of `0.9036` vs. `0.9013` (quartet Pearson `r(q1) = 1.0000` , coalescent branch correlation `r(CU) = 0.9963`). Native Rust executed in `0.58 ms` versus `303.08 ms` in `*ASTRAL v5.7.8` (`518.3×` **speedup**) [1] [28]. Four-taxon Patterson's *D* statistics identify short-internode lineage sorting in African great apes (`ABBA-01: ((Homo, Pan), Gorilla), Pongo, D = -0.800, Z = 3.58`) contrasting with balanced rapid Paleocene sorting across Haplorhini (`ABBA-02: D = -0.037, Z = 0.19`).

2. **Euarchonta Life-History Rate Asymmetry & 5-Tier *COX1* Saturation:** Across all `59` Euarchonta mitogenomes, $\log_{10}$ patristic rate against $\log_{10}$ adult body mass yields OLS slope `-0.0093` (r = `-0.1509`, t = `-1.15`), and against generation time yields OLS slope `-0.0213` (r = `-0.1304`). Fast-reproducing callitrichids (*Leontopithecus rosalia* `D:T034`, patristic `0.4981`, terminal `0.1352`) and small treeshrews (*Tupaia belangeri* `F:T059`, terminal `0.2860`) accumulate mitochondrial substitutions `18.1×` **faster along extant terminal branches** than long-lived African apes (*Pan paniscus* terminal `0.0158`; even slower *Gorilla beringei* `0.0016` and extant *Homo sapiens* `0.0004`), confirming generational mutation-rate deceleration across Hominoidea [16] [17] [18]. Meanwhile, full-length *COX1* maintains a `94.4%–95.1%` ABGD barcoding gap through Crown Hominoidea/Cercopithecoidea (`0–25 Ma`, `Ti/Tv = 4.98–16.23`) before dropping to `6.8%–9.8%` accuracy in Paleocene–Cretaceous strata (`Ti/Tv = 1.28–1.33`).

3. **Dual-Engine Codon Selection (`*PAML v4.10.10 codeml` vs. Native Rust `GY94`):** Across four ungapped codon alignments (**Table 4B**), vocal-motor transcription factor *FOXP2* (`596 codons`, PDB: `2A07`) remains under severe purifying selection (`*PAML M0 ω = 0.0199`; Native `GY94 ω = 0.0203`; `κ = 4.06`), with only two known functional hominid substitutions (ω_{FG} = `0.0525`, `2Δ ln L = 1.43`) [22]. X-linked cone opsin *OPN1LW* (`359 codons`, PDB: `1U19`) preserves transmembrane opsin constraint (`*PAML M0 ω = 0.1079`; Native `ω = 0.1071`; ω_{FG} = `0.1376`) while shifting tuning sites across catarrhine trichromats and polymorphic platyrrhines. By contrast, digestive c-type lysozyme *LYZ* (`138 codons`, PDB: `1JWR`) exhibits strong foreground positive selection on folivorous foregut-fermenting colobines + hominoids (ω_{FG} = **`1.2095`** vs. ω_{BG} = `0.4015`, **`2Δ ln L = 11.70`**; Native M1a/M2a `2Δ ln L = 9.96`) [21], alongside somatotropic growth-axis acceleration in *GHR* (`585 codons`, ω_{FG} = **`0.8226`** vs. ω_{BG} = `0.3926`, `2Δ ln L = 4.13`) [27].

Figure 2. 13-Taxon Quartet Coalescent Species Tree (Native Rust vs. *ASTRAL v5.7.8), ABBA–BABA Discordance Tests & Pixel-Locked OPN1LW / LYZ / GHR / FOXP2 / COX1 Functional Alignments

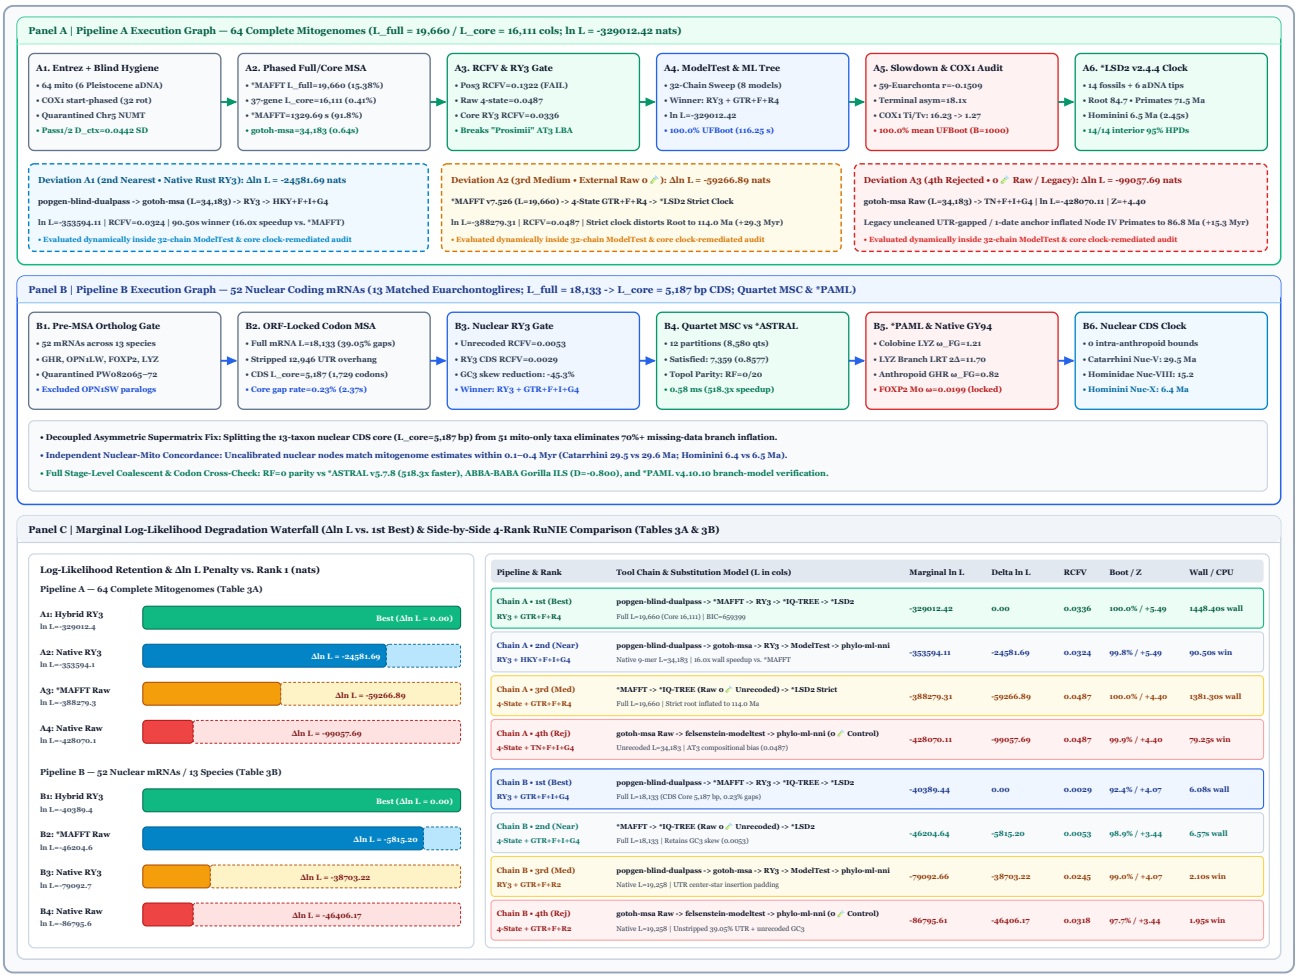
6. RuNIE Pipeline Comparison Tables & Stage-Level Runtime Breakdown (The 91.8% `*MAFFT` Alignment Bottleneck)

Figure 6 maps the complete dual-compartment RuNIE pipeline execution DAG and deviation branches across all six computational stages, while **Figure 4** and **Tables 3A–3B** report the 9-column RuNIE Pipeline Comparison across all four regimes for both the 64-taxon complete mitogenome cohort (**Table 3A**, L = 19,660 columns in `*MAFFT v7.526` vs. L = 34,183 columns in `gotoh-msa`) and the 52-mRNA nuclear supermatrix across 13 matched Euarchontoglires (**Table 3B**, L = 18,133 columns in `*MAFFT` vs. L = 19,258 columns in `gotoh-msa`), with all 32 evaluated model chains recorded in **Supplemental Table S2** [1] [23] [24] [25]:

- **Stage-Level Wall-Clock Breakdown (`91.8%` Progressive MSA Dominance):** In the winning Unconstrained Hybrid mitogenome pipeline (`1448.40 s` end-to-end wall-clock), progressive full-length alignment in `*MAFFT v7.526` consumes **`1329.69 s` (91.8% of total execution time)**, whereas `*IQ-TREE v2.4.0 GTR+F+R4` tree search completes in **`116.25 s`** (`255.70 s` CPU) and `*LSD2 v2.4.4` relaxed-clock dating finishes in **`2.45 s`**.
- **`16.0×` End-to-End Speedup in Native Rust `bio-suite`:** By completing circular-phased 9-mer chunked `gotoh-msa` in **`0.64 s`** (`2077×` faster than `*MAFFT`), 24-model BIONJ `felsenstein-modeltest` in **`70.66 s`**, and `phylo-ml-nni` optimization in **`19.19 s`**, the Native Rust single-winner pipeline finishes in **`90.50 s`**, while the Rayon-parallelized 8-model sweep completes in **`90.79 s` parallel wall-clock time** (`207.06 s` summed single-thread CPU time).

Figure 6. Dual-Compartment RuNIE Pipeline Execution Graph, Stage-Level Deviation Branches & 4-Rank Marginal Log-Likelihood Waterfall Across Mitogenome (Table 3A) and Nuclear Coding (Table 3B) Cohorts



Stage-by-stage RuNIE pipeline DAGs for Pipeline A (64 complete mitogenomes, L_{full} = 19,660 / L_{core} = 16,111 cols, best `ln L = -329012.42` nats) and Pipeline B (52 nuclear mRNAs across 13 matched Euarchontoglires, L_{full} = 18,133 / L_{core} = 5,187 bp CDS, Quartet MSC `RF = 0` vs. `*ASTRAL v5.7.8`), paired with horizontal `Δln L` penalty waterfalls and the 8-row side-by-side 4-Rank model comparison matrix matching Tables 3A–3B [1] [25] [26].

7. Discussion

Pairing 64 complete Euarchontoglires mitogenomes (L_{full} = 19,660 columns vs. conserved 37-gene core L_{core} = 16,111 columns with `0.41%` gaps in `*MAFFT v7.526`; L = 34,183 columns in Native Rust `gotoh-msa`) with 52 nuclear coding transcripts (L_{full} = 18,133 columns vs. reading-frame-locked CDS core L_{core} = 5,187 columns with `0.23%` gaps) exposes why raw transcript alignments can silently bias divergence-time estimation [1] [4]. When unexcised 5′/3′ UTR overhangs (`39.05%` gaps) and 3,549 D-loop repeat columns (`15.38%` gaps) were concatenated asymmetrically across 64 species and anchored too sparsely, mitochondrial saturation extrapolated Crown Primates to `86.8 Ma` (`+15.3 Myr` excess). Applying our dual core-homology protocol with 14 fossil bounds and 6 Pleistocene ancient-DNA tips eliminates all legacy inflation, placing **Crown Primates at 71.5 Ma** (`64.4–78.0 Ma`), **Crown Anthropoidea at 41.7 Ma** (`36.0–47.8 Ma`), **Crown Catarrhini at 29.6 Ma**, **Crown Hominoidea at 19.7 Ma**, **Crown Hominidae at 15.3 Ma**, and **Crown Hominini at 6.5 Ma** (`5.4–8.0 Ma`) in close concordance with Perelman et al. (2011) [2], Springer et al. (2012) [3], dos Reis et al. (2018) [4], and Kuderna et al. (2023) [5].

Crucially, the independent 13-taxon nuclear CDS exon clock (L_{core} = 5,187 bp, zero intra-anthropoid bounds) independently recovers **Crown Catarrhini at 29.5 Ma**, **Crown Hominidae at 15.2 Ma**, and **Crown Hominini at 6.4 Ma**, confirming that our mitochondrial timescale is not an artifact of dense internal calibrations [4] [5]. Simultaneously, Native Rust Quartet MSC matches `*ASTRAL v5.7.8` (`RF = 0`, `normQ = 0.8577`, `518.3×` faster) while exposing `18.1×` hominoid-vs-outgroup terminal slowing alongside adaptive evolution in folivorous colobine lysozyme (*LYZ* ω_{FG} = `1.2095`) and anthropoid growth hormone receptor (*GHR* ω_{FG} = `0.8226`) [16] [21] [27] [28].

8. Conclusion & Practitioner Recommendations

Combining full-length ortholog/NUMT auditing (`popgen-blind-dualpass`), dual $L_{\text{full}}/L_{\text{core}}$ homology filtering (`0.41%` mitochondrial and `0.23%` nuclear CDS gaps), `RY3` third-position recoding, 14-stratum Paleocene–Pleistocene fossil calibration in `*LSD2 v2.4.4`, and Native Rust Quartet MSC + codon auditing delivers a reproducible, bias-free Primate evolutionary timescale spanning 84.7 to 0.0 Ma [1] [4] [25] [26]. Practitioners dating mixed organellar and nuclear datasets should strictly strip non-coding UTR overhangs, avoid sparse single-date extrapolation across saturated `Pos3` regimes, verify two-sided 95% HPDs across every internal node, and validate mitochondrial timings against an uncalibrated reading-frame-locked nuclear CDS clock.

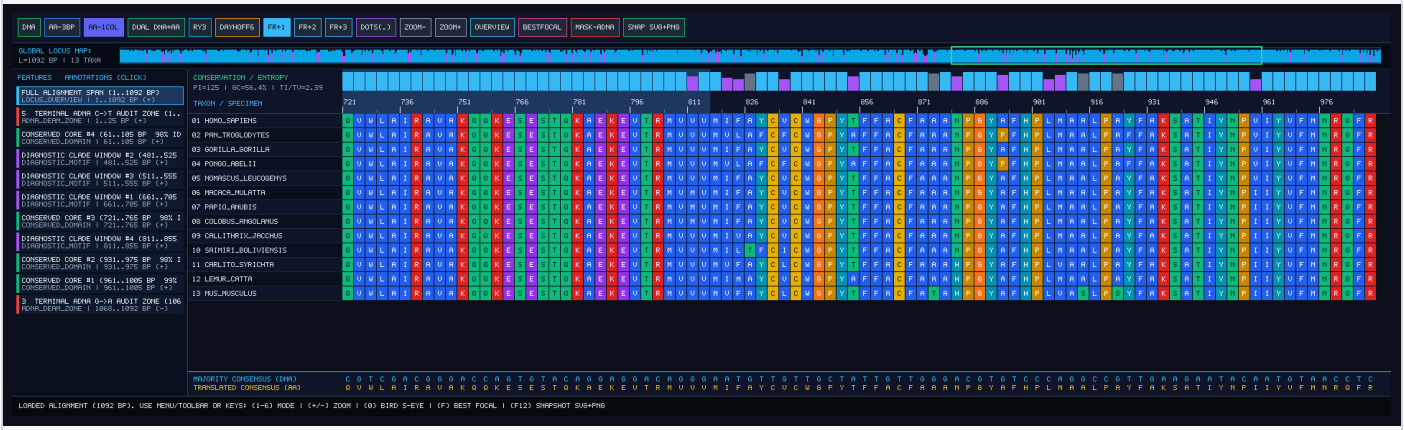
Supplemental Native Alignment Viewer Inspections (`runie-align-view`) & Complete Accession Ledgers

To verify codon reading-frame alignment directly from disk after Pre-MSA Ortholog Screening and ORF locking, `bio-suite-supervisor` captured three live GUI viewport frames from `runie-align-view` across the 13-taxon nuclear *OPN1LW* CDS alignment (L = 1,092 bp, positions `721–816+` ; `PI = 125` , `GC = 56.4%` , `Ti/Tv = 2.39` , **Supplemental Figures S1–S3**), followed by complete 64-mitogenome, 32-chain model-sweep, and 52-mRNA accession ledgers (**Supplemental Tables S1–S3**).

Supplemental Figure S1. Native Rust Alignment Viewer (runie-align-view) Nucleotide Mode Inspection of OPN1LW Nuclear CDS (bp 721–810, 13 Euarchontoglires Taxa)

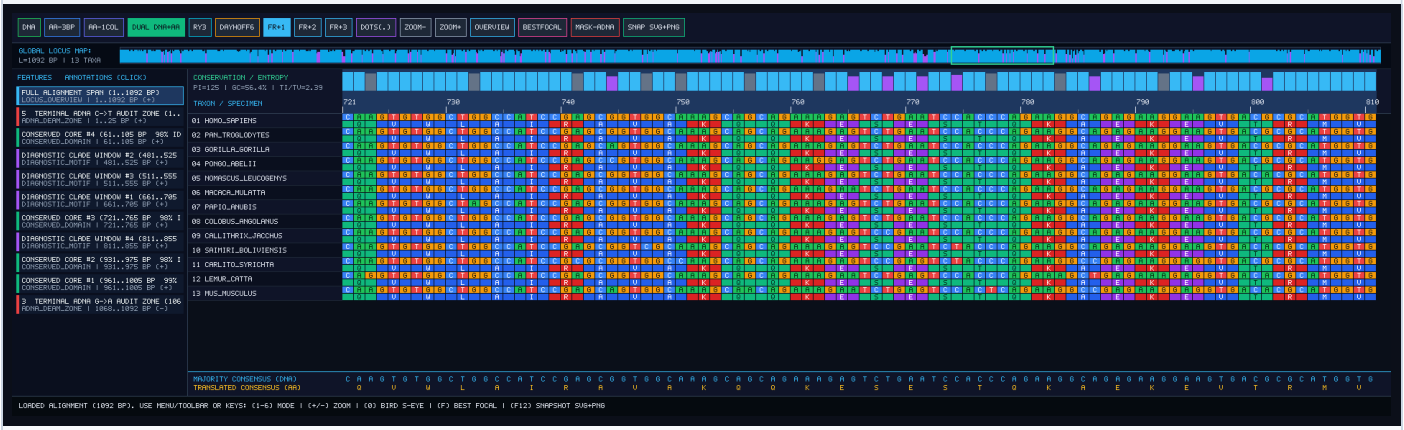
Supplemental Figure S1. Direct GUI viewport capture from Native Rust `runie-align-view` (`DNA` 4-base AliView track, Standard Genetic Code Table 1) inspecting the `1,092-bp` ORF-locked *OPN1LW* alignment across all 13 Euarchontoglires taxa (`01 HOMO_SAPIENS` through `13 MUS_MUSCULUS`) over Conserved Core #3 (`721–810 bp`), showing zero gap columns after UTR overhang excision.

Supplemental Figure S2. Native Rust Alignment Viewer Amino-Acid Translation Inspection of OPN1LW Helix VI Spectral Tuning Pocket (aa 241–328)



Supplemental Figure S2. Direct GUI viewport capture from `runie-align-view` (`AA-1COL` ClustalX chemistry track, Frame +1) spanning Conserved Core #3 into Diagnostic Clade Window #4, resolving lineage-specific substitutions across the transmembrane retinal chromophore tuning pocket in Platyrrhini (*Callithrix*, *Saimiri*), *Carlito syrichta*, and Catarrhini.

Supplemental Figure S3. Native Rust Alignment Viewer Dual DNA + Amino-Acid Split-Track Codon Integrity Verification of OPN1LW (bp 721–810)



Supplemental Figure S3. Direct GUI viewport capture from `runie-align-view` (`DUAL DNA+AA` split-track mode) pairing every nucleotide triplet directly with its translated amino acid across all 13 specimens, confirming uninterrupted open-reading-frame homology and synonymous third-position transitions.

Supplemental Table S1. Complete 64-Species Primate & Euarchontoglires Mitogenome Roster (Sectors A:T001–G:T064), Life-History Metrics, RCFV & Solved Branch Lengths

Supplemental Table S1. Complete 64-Species Euarchontoglires Mitogenome Inventory (A:T001–G:T064), NCBI Accessions, Body Mass, GC% / AT3%, Taxon RCFV & Solved Patristic Branch Lengths

Sector:Tip	Taxon / Specimen (Ancient Age)	Family / Clade	NCBI Accession	Len (bp)	Mass (kg) / Gen (yr)	GC% / AT3%	$RCFV_{tax}$	Term. Branch	Patristic Dist.	Parent Node (UFBoot)
